

LEARN AT CHESTERZOO

An extremely high risk of becoming Extinct in the Wild

Name	Rufous-fronted Laughingthrush.
Scientific Name	<i>Garrulax rufifrons</i> .
Threats (why they're at risk)	Heavily exploited for the songbird trade. Additional threats include climate change and volcanic activity.
Distribution (where they live)	Western and central Java, Indonesia.
Habitat (what they live in)	Found in mountainous primary forests.
Diet/Feeding strategy (what they eat and how they eat it)	Berries and insects; mostly beetles and caterpillars.
Social behaviour (how they live)	Known to forage in small groups, moving rapidly through the forest. Breed in May/June.
Males and females	No notable difference between males and females.
Lifespan (how long they live for)	Unknown.
Number of young (how many babies)	Two or three individuals.
Interesting fact	They build a solid cup nest in branch forks close to the ground.
